RaguSaucy96

## Follow Up: Pixel 10 Pro's 12-Bit DCG vs 10-bit ADC mode DNG samples in high dynamic range scene are here. Results speak for themselves.

A multigenerational level improvement in quality for sensors with this tech is now proven to be real. I've written on here initially about what's happening (see older post)

<https://www.reddit.com/r/GooglePixel/s/E85HvSzPDZ>

And then on r/Android here...

<https://www.reddit.com/r/Android/s/OphZxTEwnU>

Long story short guys, Google Pixel feelings aside, props to Google for finally exposing access to the DCG tech. This is to be applauded and should be the benchmark on other devices which also have DCG access. Long have OEMs locked us out of this feature (Samsung, Vivo, Xiaomi, OnePlus, Sony)

Here's the DNGs. Edit them, push them, you'll immediately see difference

<https://drive.google.com/drive/folders/1KtfzcxgUNCEPQHJMICEzXrhBrpDE84>

The dynamic range and noise control advantages brought forth elevate the sensors capabilities beyond imagination!

[https://youtu.be/yf\\_aWH0sjpk?si=Li01wb8fivWT4xLN](https://youtu.be/yf_aWH0sjpk?si=Li01wb8fivWT4xLN)

And the best part is no root required!

Spread the word, folks - and demand no less

[https://drive.google.com/drive/folders/1Ktfzcx\\_b\\_gUNCEPQHJMICEzXrhBrpDE84](https://drive.google.com/drive/folders/1Ktfzcx_b_gUNCEPQHJMICEzXrhBrpDE84)

Otherwise, a quick comparison here

<https://imgur.com/gallery/hKHFzmB>

Long story short, DCG technology produces a multi generational leap in quality improvement with zero compromises. If you push the RAW files the difference is even more astonishing. And yes, this mode impacts RAW files, photos AND video!

Edit: fixed link, broken, at first, d'oh

Edit 2: Here's an amazing video summary of all the events to date and a real field test of DCG on the Pixel 10 series!

<https://youtu.be/YVj6JYXF14M?si=iMzWEubj8eFygGUL>

**Glove\_Lanky** • 5mo ago

Pixel 10 Pro

I only use stock camera app and I have a Pixel 10 Pro. Do I benefit from this?

**RaguSaucy96** OP • 5mo ago • Edited 5mo ago

If Google really leverages it, you should however it's hard to say what processing pipeline they have decided on. They could rely Instead on simpler exposure bracketing via multiple images for example. You can turn the mode on and off on demand if you do that and lose single frame advantage.

**Ifihadanameofme** • 5mo ago

Please google unlock DCG for 8 and 9 series as well :)  
thank you.

**RaguSaucy96** OP • 5mo ago

This is what we're here for 🌈 It's dormant on those two. Google even admitted it on P9 keynote, their so called dual exposure term

**theavideeverything** • 5mo ago

Is there a way to enable DCG for Pixel 8 Pro now? I don't mind rooting and mods.

**RaguSaucy96** OP • 5mo ago

[Skip to main content](#)[+ Create](#)**KaloyanBagent** • 4mo ago

There is a video of some Porsches shot on pixel 8 at 12 Bit DCG

**RaguSaucy96** **OP** • 4mo ago

Haha, my comment didn't age well 😂 The community has since broken through and extracted the DCG modes after reverse engineering how the P10 used it. Basically forcing the sensor mode which we didn't know to do.

So yep! You are now correct

**Ifihadanameofme** • 4mo ago

There is!! We tried something and it worked and is very easy if you already have root! You just need to install an app by a community member of motioncam pro app, or you can do it manually using termux but the app lets you do it from your quick settings so it's like turning on flash when needed. Pixel 8 and 8 pro both have it and pixel 9 pro as well!!!!

**insidekb** • 4mo ago

P8 Pro | P4 XL | 🍏 15 Pro | X100 Ultra | Microsoft Lumia 950

Question is, by unlocking DCG is it possible to make stock camera app or RAW photos utilize DCG besides MotionCam.

It is crazy that Goggle don't utilize their hardware, same as with Tensor G3 which supports AV1 encode and decode.

**Ifihadanameofme** • 4mo ago

So the thing is, that video boost file you get when you record it does use the DCG although it doesn't look nearly as good because of shitty processing but nevertheless it was the clue that got us thinking how can we enable it by force.

1 month and we can force DCG but it is limited to a secondary 16:9 stream which is not the full sensor but a crop of it. Still you get 4080\*2288 res up to 4k60. Stock is out of the question but other third party apps can utilise it. For photo I haven't tested with other apps but if there's a gcam where you can chose the RAW\_SENSOR stream manually, it should work. Motioncam has it all already for years now so all you need to do is enable it, pick the right stream and then boom. Shoot video or whatever, you have DCG. It's quirky ik but that's google to blame for.

We can have it just like the p10 hence the original comment. You can use DCG for photos ofcourse but again it won't be full sensor 4:3. But p10p doesn't have 60fps DCG (yet) so there's that. We got the 4k 60 12bit DCG on p8p.

[Skip to main content](#)[+ Create](#)

figure out the root, though I've never done it before.

Also I have a base Pixel 7, do you know if this model can also enable it?

**Ifihadanameofme** • 3mo ago

Pixel 7 doesn't have DCG Google started using GNK sensor on the main since pixel 8 and they even enabled it since then but was hidden till pixel 10 series.

Rooting is easy on pixels. The actual execution won't be longer than 15-20min max ig.

For DCG you can use an application called "Mod tile manager" with which you won't need to use termux (basically saves you time and learning a terminal user interface). You basically add the sensor mode you wanna force in the entry on the application and then add a quicktiles that acts as a switch. Quick and easy .

For my pixel 8 pro the sensor mode is 11.

You should join the Motioncam discord if you want more resources etc. Other devices such as Xiaomi 15u are way better in both IQ, SOC, and features so if you are planning to upgrade you can see what different devices offer. It's a fun community for people who want more than vanilla :-)

**Max\_overpower** • 3mo ago

That's unfortunate. I guess I'll still get some life out of the 7 without root then.

I tried motioncam raw10 video once, and it was kinda nice after some heavy color tweaking, but the conditions weren't ideal since it was super shaky from high wind (mostly fixed in resolve) and the panning warranted 60 fps. 4k60 could only keep up for 5-8 seconds at best before dropping frames, but I hear it hasn't improved much even with Pixel 10. More relaxed 4K30 shots could probably deliver nice results in a pinch.

**Ifihadanameofme** • 3mo ago

[checkout this channel](#)

The guy been posting regularly and he shoots on his pixel 7 pro. My 8 pro can do 4k60 for a good while although the tensor is shit and the moto edge 50 pro for example can not only do DCG but can do 4k30 for like hours..and can even do 4k60. That's a \$200 smartphone (although you do need root to tweak things a little so that you get both of them but it ain't rocket science xd).

Usually with pixels you get great support, but the SOC and thermals hold it back a lot. I would suggest you to shoot RAW only. And idk what was the most troubling part of the experience but honestly I would be glad to help you with anything because there aren't many tutorials huh. For stabilization try

[Skip to main content](#)[+ Create](#)

reduce the viewfinder resolution and pro tip - use the eye of sauron looking button on top left to get rid of the shitty android preview and have a direct preview of what you are shooting. It is accurate and you can expose using false color and what not in that mode.

For quick results you can just export it using a lut from manage videos tab (edit video) and get a regular HEVC file with your baked in look (luts that have rec709 output will all work).

**Max\_overpower** • 3mo ago

Thanks for the help. I think resolve can fix most stabilization woes. For the record, motioncam was mostly reporting "I/O overloaded", which I suppose could mean CPU throttling under the hood even though it's more directly pointing at RAM / buffer not unloading to storage in time.

The channel you sent only shoots low frame rate, and I imagine I won't have trouble shooting 30 fps for sufficiently long periods, it's just 60 fps that is problematic. I also haven't seen evidence of moto edge doing 60 fps for long periods of time, for what it's worth.

I recently factory reset the Pixel 7 which surprisingly did fix its previously broken mobile calling functionality. I just wanted to get DCG out of the way (had it been possible) now before switching over from my backup 4a 5g. TBH switching back might be hard after using the perfect rear capacitive fingerprint sensor :D

**Ifihadanameofme** • 3mo ago

[here this should do as a 60fps showcase I believe.](#)

Although it won't be this good stock but community already unlocked it's potential and if you are rooted you won't have to do it yourself :-)

And yeah I think pixel 7 won't be able to handle 4k60. That's one of the more demanding tasks so a good SOC will be needed . But most of the times it's the OEM that throttles the Device to heavens so even something like a s25u would die but then with root you can tweak it and get it to run forever.

Recording to external SSD also helps a lot as it takes away the stress.

And man did I love my capacitive fingerprint sensor 🤖 I don't hate the in display fingerprint but there are some things which will stay being better in terms of how they feel at least.

Also if you plan on getting a device just for video or something then so consider the moto because it's goated and rooting is as easy as it is on pixels almost and the community is constantly improving it.

[Skip to main content](#)[Create](#)

Again I wish OEMs didn't lock it all down..there are things locked down or completely hidden such as DCG for YEARS ...huh Good luck man!  
RAW life is the best life 🤪

Ifihadanameofme • 5mo ago

Beating around the bush won't help. We need to bring them to the round table conference and ask the right questions 😊 We have this tech for ages now. Forget about fancy 8k 240fps or video boost that in itself is 240MBps data way better than stock.

Voided\_Chex • 5mo ago

Your English is so odd -- are you an AI?

TheTomatoes2 • 5mo ago

9 Pro | 7 | 5a | 4a | 3 🏆 Top 1% Commenter

And there isn't some ADB command to enable it?

Ifihadanameofme • 4mo ago

There is. No adb, you can do it using termux. Just you need to enable forcedsensormode 11. Either you use termux or use an app called mod tile manager by a community member of motioncam. There you just need to enter number 11 and add the quicktile in your quick settings panel and done. Turn it on and off at will lol.

satellite779 • 5mo ago

I doubt they'll improve previous gen phones as that doesn't bring them any money. They want to sell P10s.

**RaguSaucy96** OP • 5mo ago

Sorry not an expert

That's why we're here to help!

The long story short, when you shoot a photo or video regardless of mode, you must select an ISO value (light sensitivity).

DCG stands for Dual Conversion Gain, not to be confused with Dual Gain.

Essentially the phone can shoot at two ISO values at the sensor circuitry level, in one single exposure!

The additional highlight and shadow data capture not only extends dynamic range, but by having two independent analogic readouts, sensor can eliminate a lot of noise and also produce 12/14-bit worth of data!

It's invulnerable to movement. Think HDR without any of its downsides!

**itsmarra** • 5mo ago

Ok very clear! Thanks

**[deleted]** • 5mo ago**CaptainMarder** • 5mo ago

Pixel 8,6,3,1, Nexus6p,5

So, suppose I use LR camera. Any idea if i have to shoot in RAW or does it still capture with jpeg at multi iso? This is crazy stuff, my mirrorless can't even do that lol.

I think all of googles camera processing does hdr stacking.

Also, wouldn't this give RAW files a lot more dynamic range?

**RaguSaucy96** OP • 5mo ago

So, suppose I use LR camera. Any idea if i have to shoot

It should! You can check yourself 😊

And yes, it's like DGO on Canon or the Arri Alexas with the crazy dynamic range.

It could produce RAWs with up to 14 stops of DR at the high ratio DCG16 (the 14-bit mode!), yes!

**CaptainMarder** • 5mo ago

[Skip to main content](#)[+ Create](#)

Yea i only have an a6400 lol. I have to bracket for hdr which is a nuisance.

14 stops in one shot is CRAZY. Is there something in the metadata or photo file that identifies if it was captured in the 12bit range?

I'm still waiting for google to ship the damn device lol. But i'm so interested in this discovery.

**RaguSaucy96** OP • 5mo ago • Edited 5mo ago

Did you watch my latest posts?? We've got field info and explanations now!! Upvotes and spreading of word are always appreciated 🙌

<https://www.reddit.com/r/GooglePixel/s/DHKIOj7OZV>

It should appear on metadata for editors like Lightroom and such

Edit: just realized your comment there lol - sorry 🙌

**Ifihadanameofme** • 5mo ago

basically that yeah. in lament terms we are basically using two iso values, a low value for shadows where the noise is the greatest on digital sensors keeping them clean and a higher value for the rest and merging them together to give a higher quality image.

**bangaal** • 5mo ago

Shouldn't we celebrate instead for this technological improvement instead of lamenting? (Sorry couldn't pass the chance on that typo!)

**Maxitay** • 5mo ago

I didn't know anything about that. Thanks for the explanation. I played with your pictures by pushing the exposure to the max on Lightroom and the difference is night and day in terms of noise. That's insane! Don't the RAW pictures with the main app benefit from that already? It's a bit of a shame that 3rd party apps manage to produce better photos/videos than Google cameras. There should be a Pro mode allowing users to use the maximum of their lenses capacity.

Hopefully Google doesn't shut this down with an update...

**RaguSaucy96** OP • 5mo ago

Welcome to our reality. I posted this on [r/Android](#) and you'd be shocked that some people think I'm lying and a cultist (not even kidding, don't know how but lol) 🙌 Proof is undeniable however, this tech is mind-blowing

[Skip to main content](#)

Create

**bulbouscorm** • 5mo ago

What the fuck is a DCG, DNG, ADC

**RaguSaucy96** OP • 5mo ago

DCG = Dual conversion Gain

DNG = Digital Negative, a photo RAW file

ADC = Analog to Digital Conversion

**Aikon\_94** • 5mo ago

Is that enabled by simply enabling raw on the camera app? Or do you need any other tweaking?

**RaguSaucy96** OP • 5mo ago

It's the new main lens default mode outside stock app

**ESCR0T0** • 5mo ago

Pixel 7 Pro

Do you mean the stock app doesn't benefit from this?

**Aikon\_94** • 5mo ago

I think that means other apps should benefit from this, producing better photos, stock camera already benefit from this... I think

**TheBooot** • 5mo ago

So some random app like Instagram should have better quality than stock app?

**Bigd1979666** • 3mo ago

Pixel 6

Any specific apps aside from motion pro ?

**u/TestinyApp** • Promoted

Test management that doesn't suck. Lightweight, fast, and built for real dev teams.

[Skip to main content](#)[Create](#)

premises.

[testiny.io](#)[Sign Up](#)**PerseveranceXXXIII** • 5mo ago

How do you even enable this?

**RaguSaucy96** OP • 5mo ago

If it's p10 series it's on by default! Photo and video apps should benefit by default, raw apps can choose raw12 stream vs raw10 to define the DCG on mode

**markovianmind** • 5mo ago

should I be using 12mp or 50mp mode?

**RaguSaucy96** OP • 5mo ago

DCG won't generally run on unbinned mode so no, avoid max res if there's any chance you get it on stock app

**aricblunk** • 4mo ago

You mention it won't generally run in full res mode, are there some situations where it can, or not on this sensor?

**RaguSaucy96** OP • 4mo ago

Not on this sensor 😊

It's not technically impossible, but quad bayer/Nona Bayer structure plays a role in the dcg architecture hence it's not so simple.

**PerseveranceXXXIII** • 5mo ago

Yep, I have the 10PXL

**Blunt552** • 5mo ago • Edited 5mo ago

Ah yes, the misinformation also being spread here I see, for those interested:

Skip to main content

Create

Now here's a thing for those who aren't as tech literate, ask yourselves this 1 question:

if this "tech" is so revolutionary and flawless, why are OEM's not using it?

If you accept what has been stated by OP, you believe the following:

OEM's lock away a "ground breaking" feature to nerf themselves and loosing out on a lot of money for no reason.

This tech has been around since almost a decade and yet it isn't being used. The explanation as to why and evidence provided by OP himself are all in the linked reddit topic above.

Furthermore OP has made claims that are straight up insane such as:

<https://www.reddit.com/r/Android/comments/1n3u9y4/comment/nbga5wc/?context=3>

Applied at the sensor level so impacts RAW, videos and photos and can make a 10-bit sensor into 12/14-bit level

He is literally stating, a sensor capable of capturing 1024 colors per channel merged with another gain of the very same sensor, will magically create an image equal to 4096 and up to 16384 colors per channel.

Let that sink in.

**Cunnykun** • 5mo ago

read this pdf and calm down

**RaguSaucy96** OP • 5mo ago

Stop harrassing me, I'm done reasoning with you

**Blunt552** • 5mo ago

Aint nobody harassing you, i'm merely debunking your misinformation which others are also doing.

The fact you want to play the victim card here in order to be free to spread misinformation is wild.

Stop spreading misinformation.

**Cunnykun** • 5mo ago

Hey Danish.. arent you old member of Motioncam?

[Skip to main content](#)[+ Create](#)**maxouille** • 5mo ago

Is it enabled by default ?

**RaguSaucy96** OP • 5mo ago

As of now, it should be as per Camera2API reporting!

**MBA\_burner** • 5mo ago

Since the ISOCELL GNK in Pixel 8 supports Smart ISO Pro as well, is there a chance that this mode could theoretically work on the P8 series as well? With a modded app maybe and not a full root?

Or do you think it's the new custom Google-designed ISP in P10 that is doing the heavy lifting here?

Bonus Q: The 48MP main camera sensor in the base P10 is the same as the main sensor in the P9A, but there isn't any information on what the exact model of the sensor is and as such, can't really confirm if the sensor sports "Smart-ISO Pro" and/or "Staggered HDR" from Samsung that's required for this capability. Do you have any info as to whether it's possible on the base P10 or not?

**RaguSaucy96** OP • 5mo ago

Since the ISOCELL GNK in Pixel 8 supports Smart ISO Pro as well, is there a chance that this mode could theoretically work on the P8 series as well?

No chance, it's a given!

<https://semiconductor.samsung.com/image-sensor/mobile-image-sensor/isocell-gnk/>

Samsung promo page about GNK. See at lowest part of document.

Staggered HDR technology in collaboration with three different ISO modes enhances ISOCELL GNK's HDR performance by producing images with a dynamic range of up to 102dB. **The single frame based Smart-ISO Pro also improves dynamic range while minimizing motion artifact, creating images with color depth as high as 14-bit.**

Furthermore, at lowest part of page, under SPECIFICATIONS, press 'view more'

Output Formats RAW8, RAW10, RAW12, RAW14

HDR Smart-ISO Pro (iDCG), Staggered HDR

[Skip to main content](#)[Create](#)

With a modded app maybe and not a full root?

No chance, even with root, nobody knows enough about the tensor Exynos firmware to mod it, Qualcomm only.

Or do you think it's the new custom Google-designed ISP in P10 that is doing the heavy lifting here?

Sensor based, we've gotten this to work with root as far back as Mi11U with GN2. With mods however, also can provide video proof but mods are public too if you've got that device.

Do you have any info as to whether it's possible on the base P10 or not?

No clue :(

**MBA\_burner** • 5mo ago • Edited 5mo ago

AH, damn! Was nice to dream for a bit. I wonder if, now that Google has exposed this capability in the relevant sensors through the main Camera2 API, they might make an engineering decision to standardize the API and libraries across multiple platforms to make software dev easier (especially since they promised to support the P8 series onwards for 7 years) and that might let the wizards over at MotionCam save the day by enabling it for the P8 and P9 too. I wouldn't mind paying a small one-time fee to buy the full app if they do manage to work their magic.

Hopefully, there's enough Google Tensor DNA common between the G3 and G5 to do just that. I wonder, if by some miracle, that will let the Sony IMX787 in the P7A and P8A tap into Sony's on-sensor qHDR implementation (Sony's version of Smart-ISO Pro) that it's suspected to have (no official confirmation though because the datasheet is not public unless you're a phone manufacturer).

Also, super surprised that Google didn't even mention this in passing during their keynote. Makes you think if the implementation is still in its infancy and Google hasn't ironed out the bugs yet and they'll try to peddle this as a breakthrough next year with the Pixel 11 or such. Especially given Google's pedigree as a mobile phone photography juggernaut and the fact that they devoted an entire section in the keynote to the P10 Pro's video capabilities. OR, more likely, the McKinsey corpo higher-ups thought it was a better idea to hammer home the AI buzz for the 786th time...

[r/MotionCamPro](#) or the discord as it's straying off topic but yes, MotionCam Labs is coming soon and specifically will aim to do these those types of exact endeavors 😊

I wonder, if by some miracle, that will let the Sony IMX787 in the P7A and P8A tap into Sony's on-sensor qHDR implementation (Sony's version of Smart-ISO Pro) that it's suspected to have (no official confirmation though because the datasheet is not public unless you know of a way to see that datasheet for that sensor).

I've used qHDR, it runs on my OnePlus 8 Pro, plus there's working mods for some other devices like Xiaomi 14U and 15U, however that method has flaws and I much prefer DCG which is basically superior in every other way except for absolute dynamic range.

Makes you think if the implementation is still in its infancy and Google hasn't ironed out the bugs yet and they'll try to peddle this as a breakthrough next year with the Pixel 11 or such. Especially given Google's pedigree as a mobile phone photography juggernaut and the fact that they devoted an entire section in the keynote to the P10 Pro's video capabilities. OR, more likely, the McKinsey corpo higher-ups thought it was a better idea to hammer home the AI buzz for the 786th time...

They stated it on P9 keynote but otherwise no mention this time. Still, the genie is out of the bottle now!

**kpalian** • 5mo ago

Pixel 10 Pro XL [Pixel 5; Pixel 2 XL]

Would it be safe to assume the 12-bit image capturing is what Google uses to get the most possible information out of 100x Pro Res Zoom photos before running them through their diffusion model and "enhancing" them?

**RaguSaucy96** OP • 5mo ago

I don't think so. I am open to be corrected but the telephoto sensor itself likely isn't DCG capable. They would likely be using that sensor plus unbinned resolution mode (48-50MP) plus AI upscaling and super resolution of their own proprietary type.

**Vince789** • 5mo ago

Pixel 9 Pro

Just wondering if you've tried AV1?

I'm curious if AV1 mode is the same quality as HEVC mode, or if you sacrifice some quality for the lower file sizes

**RaguSaucy96** OP • 5mo ago

[Skip to main content](#)

**mavispuford** • 5mo ago • Edited 5mo ago

Pixel 9 Pro

Is this related to the fact that when using a PreviewAnalyzer, the image proxy now rolls in as YUV420888 instead of NV21? I switched from a P9 Pro to a P10 Pro and noticed that the type has changed.

**RaguSaucy96** OP • 5mo ago

I don't believe that's related as end file should be still as before unless it's a DNG. Nevertheless the superior capture quality will reflect on the result if DCG was enabled. It's hard to miss this 😊

**Airlight** • 5mo ago

I've been disappointed in the p9pro xl photos since I bought it (it seems much more noisy and relies more on image stacking to reduce noise than even the p7a Sony sensor did). I am very surprised that this isn't already being used. I am expecting this to trickle down to the 9 series aswell, if not I'll be extremely disappointed.

**RaguSaucy96** OP • 5mo ago

It's been present since P8P 🤔

I have one, and have known this for ages. People wouldn't understand this before and may have thought it was pixel hate. This is why this event is important, the truth is out and now verified as reality.

It's same for other devices outside of Pixels. DCG is dormant and out there. Older devices have unlocked it with mods but you see the issue? Why must it be that way.

Share this shit, spread the word, educate others. The improvement is undeniable and we've been getting robbed of it for ages.

**Airlight** • 5mo ago

Yes, I have lots of questions! Did Google lack the knowledge to properly implement this in the 9 series? It seems insane to not fully use the technology they are paying Samsung for in this case with the isocell sensor. I have so many images taken with my phone where the raw image is blotted by patchy noise blobs, where the multi-stacking failed to neutralize it for some reason. I have some horror images where shooting into the sunset from a moving vehicle leaves an almost unusable image.

Example just to illustrate:

[https://drive.google.com/file/d/1SB51xNeRJ\\_lIj1jgRi1i5IVjM3m8WxjY/view?usp=drivesdk](https://drive.google.com/file/d/1SB51xNeRJ_lIj1jgRi1i5IVjM3m8WxjY/view?usp=drivesdk)

Notice the blotchy color noise in the dark areas of the seat. This image on my old pixel 7a would have been much more usable and with a pleasing, consistent noise floor appearance. The p9 looks

[Skip to main content](#)[+ Create](#)**RaguSaucy96** OP • 5mo ago

Yes, I have lots of questions! Did Google lack the knowledge to properly implement this in the 9 series? It seems insane to not fully use the technology they are paying Samsung for in this case with the isocell sensor

Basically it's toggled by the OEM as a sensor function or mode, so not related besides the fact they perhaps needed to adjust pipeline for extra capabilities and opted not for many potential reasons (maybe too much work, maybe they didn't want aux sensors to look like shit vs main, maybe they prefer classic bracketing, maybe they don't care - I could go on)

I have so many images taken with my phone where the raw image is blotted by patchy noise blobs, where the multi-stacking failed to neutralize it for some reason. I have some horror images where shooting into the sunset from a moving vehicle leaves an almost unusable image.

That's down to their processing. The raw outputs can be rather decent but if processed poorly, you get just that.

Notice the blotchy color noise in the dark areas. This image on my old pixel 7a would have been much more usable and with a pleasing, consistent noise floor appearance. The p9 looks hideous, frankly.

Later model processing has taken a nosedive for sure. Try a gcam mod in comparison for example - even without DCG you can get better results. This is just the tip of the iceberg.

Very interesting, so glad you brought this to our attention here. When I saw that the pixel 10 pro/xl were using essentially the same sensors as the p9 pro/xl I just wrote off those phones as similarly "incapable" as my p9pro xl.

Do you know if the example photos you posted were captured using gcam, or some other photo app where they could toggle the dual gain mode on and off at will for the P10 pro?

**RaguSaucy96** OP • 5mo ago

r/MotionCamPro was used 😊

Can do just that, however keep in mind there's a barrage of updates as it's been otherwise bugged a bit for now on p10 model. Jump there for more on that as it's going a bit off topic 😊

Anybody actually know what the data rates and recording limits is for this (if there are bottle necks to recording times etc)?

**RaguSaucy96** OP • 5mo ago • Edited 5mo ago

It's highly dependent as recording in MCRAW is using data lossless RAW compression (which can reduce size by up to 50% depending on lighting).

Bottlenecks are strictly overheating or having a bloated device which leech power away.

Pixel 6

So in summary, is this a method now available on stock cams? I'm currently using the 50mp lens and get considerably better pics than the default settings.

У базового samsung s25 основной модуль камеры isocell S5KGN3, он поддерживает технологию Smart ISO Pro, так что теоретически он может снимать такие же качественные видео, как и google pixel 10?

**RaguSaucy96** OP • 3mo ago

Indeed it can!

They've had this mode available for years with Samsung devices, they simply don't properly leverage it
