I am going insane. Can anyone figure this out?

Hello,

I have [twice submitted](#) that my phone has decided to adaptively charge to 100% by 9am. The first submission happened (Pixel 9 Pro XL), and I did factory reset to fix it, and eventually it came back. I recently upgraded to the Pixel 10 Pro XL and it was fine for a few weeks and it is back. To be clear, I get up around 6 every day but I use my Garmin watch for the alarm so I don't disturb my partner. I know a "silent alarm at 6am" is a solution to the charging.

But here is the fun new development. Today all of a sudden I have a new thing on my lockscreen and showing at all times on my AOD. [An alarm for 9:00AM](#). But when I click on that alarm it brings me to clocks and nothing is there. It is frustrating because that 9:00AM alarm is now ALWAYS being displayed on my AOD (taunting me).

I asked Gemini "do I have any alarms set" "No you do not have any alarms set". My "bedtime" routine says 10:15pm-6:30am (but I never use that). I am at such a loss. I've basically just gotten over the fact that my phone refuses to charge appropriately, but the always on display showing a 9AM alarm that doesn't exist is driving me crazy. Any suggestions?

EDIT: to the person going and downvoting all of my troubleshooting. Thanks? This is an actual problem I've been dealing with for nearly a year and it's really hostile to just downvote the post and my attempts to troubleshoot.

Pixel 6 Pro

You have an app that is setting a reliable alarm. It's not necessarily an alarm that you will hear. Tasker can do this. See if you have an app doing that.

...now can't find the app. Short of uninstalling and reinstalling every app one at a time

Pixel 6 Pro

No idea. If it appeared recently, see if you can figure out what changed. But, I'd be willing to bet that's it.

**christmas_ape** OP • 2mo ago

It appeared recently, but it has always appeared eventually. When I had my 9 Pro XL the same behavior happened. So if that is the culprit, it's not a new app. I'll have to do some digging. But this does sound like a good theory on why it's happening. Thank you

Pixel 6 Pro

Try Settings --> Apps --> Special App Access --> Alarms & Reminders

**christmas_ape** OP • 2mo ago

I have as "Allowed", Digital Wellbeing, Google, Messages, Pixel Screenshots. Everything else is "Not Allowed". I tried toggling all three of those to "off" but the alarm is still there. Good suggestion though.

**RockOutToThis** • 2mo ago

Pixel 7

Have you reset it at all since the new issue? Try powering it down for >10 minutes and then seeing if it's still an issue.

**christmas_ape** OP • 2mo ago

Will try that later today. At work now. Thank you for the advice

**DuncanCraig** • 2mo ago

Pixel 9 Pro

What about under Bedtime in the clock app, is it set for 9am?

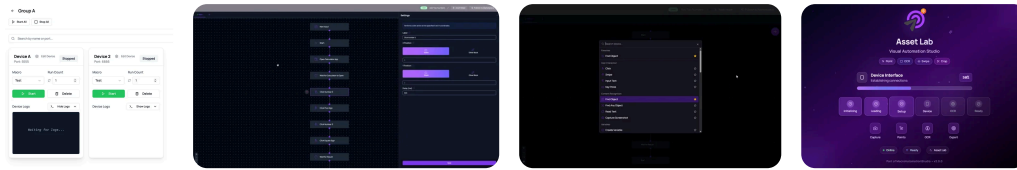

Just checking in case there is a weird glitch where it is not showing on the Alarms tab.

**christmas_ape** OP • 2mo ago

Nope. Mentioned in the post. That's set for 6:30, but I never use it. Thanks for the suggestion

Have you tried to clear the cache for the alarm? Also check your Google calendar and make sure there isn't anything set on a daily that mimics an alarm setting.

**christmas_ape** [OP](#) • 2mo ago

Thanks for the suggestion. Cleared the cache for Clock and no change. I don't have anything in Google Calendar from what I can tell.

**fabricchamp** • 2mo ago

I notice in your screenshot you have a profile photo top right, does that mean you have multiple profiles set up? Maybe another profile has an alarm set which is causing the issue?

**christmas_ape** [OP](#) • 2mo ago

Good catch. I had the same thought. I have a work profile. I deleted the work profile to see if that fixed it. It didn't seem to fix anything. Also, historically, I have only had the work profile for a few months and my first posts about this were about 9 months ago. Thanks for the suggestion though.

**fabricchamp** • 2mo ago

Long shot, but, could you maybe have a Google Assistant/Gemini routine that is running erroneously?

**christmas_ape** [OP](#) • 2mo ago

I just checked my Google Home app, I don't have any automations that are triggered by time. I have a good morning / good night that are triggered by those phrases (honestly haven't used them in years). When I go to "Activity" nothing happened at 9:00AM today. I asked Gemini if I have any routines setup and it just listed a bunch of lighting scenes through the hue app

[Skip to main content](#)[+ Create](#)

100% certain it's this, or with a remote chance having to do with the recently known calendar bug issue I'll later explain further, below.

Try the following first and I believe you'll find the culprit:

1. voice activate your device assistantS (Gemini as your assistant first, then if doesn't work better hope it allows you to change to Google Assistant still and try these steps again)
2. You're going to prompt /ask it multiple offshoots of actions to run which I'm free you'll catch my drift as follows: "start/run/begin/activate/etc...": my morning routine, my wakeup routine, my wakeup tasks, My morning tasks, my schedule today, my daily task... and... Tell me about my tasks today.

I'm pretty confident one of these will work as it did for me, just can't remember exactly which one it was but I think it was the last one I listed.

My mind was blown with what it was saying, running, or thinking it found, where it found it, how it found it, Or was mind mapped/ coded to connect to, etc.

Then had to be quite inquisitive with follow-ups to figure out what it was finding and where it was for me to access. It made profusely keep wanting to either explain where it's located or how to access it but it can help you just do whatever you want to do or change whatever you want to change so let it know, but then ask for it to open directly for you the setting or provide a linkified URL protocol to the setting or whatever it explained it thinks s it's located and mapped to from its memory that it recalled and provided you this so that you could MANUALLY see it and make needed changes, since you're losing your voice.

Part 2 - Remote chance it has to do one of these borked integrations

Not sure many are aware that there is a new "enhanced" keeps, routines, calendar tasks, and reminders (botched) integration and workflow. The best I can explain it is a failed or lack of education provided to users of multiple integrations of features and services for different end of life apps, Services, features, etc including any of those provided by the many faces of Google Assistant. At some point long ago this was also news to me but by this I mean there are also, even still, multiple faces /capabilities of the assistant(s) where it's like playing Russian roulette as to knowing who you're getting or what you're getting when activating the assistant through manual methods with your hand or with hands-free voice activation.

For example, if you use or have used any pixel buds, home devices with assistant built in, or Google Assistant capable devices (nest cam, Chromecast, g tv) that depending on how and when it's activated and by what method, in what state (device lockdown or trusted devices/places unlocked) your phone is in then the activated assistant you are using, even if it sounds like Gemini, it's different which translates to it's pipeline, capabilities, protocol and syntax mappings also being different or even limited at many times.

Same applies to your Android auto device, how you have it configured, the state you are actively connected to it in (wired, wirelessly, or even both) when activating to use the assistant you may get a different one than your expecting or assuming to be using (even more crazy, different assistant functional capability activated and used when using Android auto with Google maps running actively for GPS routing /navigation to a destination).

Create

you're not sure which one you got and where it may have saved or mapped it to.

Hence leading to this final point and explanation of there half-baked, partially bifurcated, roll-up integration upon roll up upon roll-up... of legacy features, Services, apps or settings and where And how exactly they were stored by each assistant you were getting at that time for: TIME/LOCATION BASED reminder/note/routine within LEGACY assistant, reminders, calendar events, tasks, keeps reminders.... Make sure you have the latest updated keeps app or maybe better online with your Google apps of keeps, tasks, reminders calendar, and going to keeps and look at archives and other folders and look through all of your notes and you're going to find some crazy stuff with some italicized namings like saying assistant or tasks or legacy reminders telling you it was brought over from other services at one point and you had no idea and it's stalled or stuck or running, I had location stuff even running that shouldn't have been on a routine
