Pixel problem driving me crazy

Help

Hi everyone,

I run a small e-commerce brand using Shopify + Meta Ads and I'm stuck in what looks like a pixel / dataset / Business Manager mismatch.

My Shopify store is connected via the Facebook & Instagram sales channel. Data sharing is set to Maximum and Conversions API is enabled. My pixel is active and tracking events correctly - I can see website traffic, page views etc. in Events Manager.

The problem is in Ads Manager. I cannot select the same pixel that Shopify is using. Ads Manager only shows another dataset/pixel which seems inactive and not receiving proper website data.

Because of this:

- I can't build proper website retargeting audiences
- Conversion optimization isn't reliable
- Campaign data doesn't match real website activity

I spoke with Meta support about 24 hours ago. They said it looks like a complex asset / ownership / Business Manager issue and escalated it to technical support, but I haven't received any follow-up yet.

I can see the correct working pixel inside Meta (Events Manager / Business settings), but I can't run ads from there because my active ad account is connected elsewhere.

I have already tried sharing the pixel to the ad account and sharing the ad account to the pixel's Business Manager both ways, but it's not possible / doesn't work.

Has anyone experienced this before?

Did Meta fix it, or did you end up creating a new clean pixel setup?

I'm still early stage, so I can rebuild if needed, but I'd prefer fixing the structure if possible.

Any advice would be appreciated 🙏

Replace the pixel

Available_Cup5454 • 2d ago

Disconnect the Shopify channel create one new pixel in the same business manager as the ad account reconnect Shopify to that pixel and run everything from that setup

Since shopify recently migrated all pixels to datasets your ad acc isnt seeing that pixel it hasnt been explicitly assigned as an asset within the new structure so u dont need new pixle u just need to bridge the connection in business manager

Upbeat-Ad5487 • 2d ago

Go to business settings then data sources > datasets (not pixel) select the active dataset click connected assets and then click add assets selct your ad account from the list and click add

Sourabh_Apage • 2d ago

In normal circumstances this should be a pretty straightforward issue to resolve by simply sharing the pixel assets with the ad account and Business Manager. Since you're facing issues with that and Meta has also not resolved it yet in my experience, these kinds of issues either get resolved eventually or keep getting delayed with no clear timeline in sight. Given it's a new account, the fastest and cleanest path is

Go to data sources in Business settings and select datasets. Find the working ID there and click connected assets to manually add your ad account. If they are in different Business managers you must share the dataset as a partner to the other ID.

If not working, just create a new pixel in Business Settings.
