Defora

...

Second day using the phone and getting "Can't load some photos" error when I try to add pictures to Whatsapp or Journal. No issues with unedited photos, only those that I edited on default Google photos app. HW issue or ???

Resetting the device seems to fix it. Clearing camera cache memory didn't help, even though it was meant on earlier posts about same issue. I wonder is this hw issue or just software? I am swapping from iPhone so not very familiar with Android yet.

edit posted also to other sub with screenshot of the error:

Did you clear the Photos app cache?

Just re-tested with picture taken today, clearing the Google Photos app's cache didn't help

What I did:

1. Tested that unedited picture taken with camera can be opened on Snapseed, then closed the app without editing photo
2. Edited(cropped) same picture with Google Photos
3. Saved edits on Google Photos

Create

6. Cleared Camera app cache, still can't open the photo on Snapseed, same error

RegrettableNorms • 2mo ago

What about if you Save as copy?

Defora OP • 2mo ago

Seems to work fine when saved as copy on Google Photos. I even took completely new picture, cropped it and saved as copy. Both original and copped-cope can be opened on Snapseed without error.

After that I cropped the original on Google Photos and it again gives the error.. to me this looks like Google photos don't "release" the photo on save and that prevents other apps using it

RegrettableNorms • 2mo ago

Yeah, seems like there is an issue with how the system links the new file created when you just "save" edits vs "save as copy" (which just overwrites the original file)

Did you try clearing the data in the Photos app? Not just the cache? It won't delete any actual photos, just the app settings

Defora OP • 2mo ago • Edited 2mo ago

Clearing the data from Google Photos removed all edited photos from Google Photos main gallery. They are still visible on backup folder... Sincerely hope those come back to gallery as it was three days of photos. Google Photos app is now "preparing backup"

1. I took new photo, cropped it on Google Photos, can't open on Snapseed, same error as original post
2. Cleared the Google Photos data (on same menu as cache clearing)
3. Photo from step 1 is lost, all photos taken with Pixel 10 Pro xl that I had edited are missing from Google Photos main view, only 3 unedited photos taken with Pixel were left into main gallery. Backup folder has everything except photo from step 1 (as I assume there was no time to backup it before I removed the data)
4. Can't test if photo can be opened now on Snapseed as it was removed with data

Edit: while I was writing this backup seems to be slowly bringing lost photos from these three days that I have owned Pixel phone back into main Google Photos gallery so at least that works properly (I was worried I would overwrite backup with what I had on phone aka lose the photos also on cloud side but luckily it wasn't the case). Only the step 1 photo from above is completely lost

won't instantly be there. Curious if that resolves it and lets you save as copy now

Defora OP • 2mo ago • Edited 2mo ago

It just got backup stuff complete on Google Photos and somehow it even found the edited picture from step 1... and it can now be opened on Snapseed

I also took new photo yet again and to my surprise Google Photos editor now looks different (version number is still same, version 7.57.0.843750501, it was same yesterday as someone on other sub mentioned their Google Photos don't look like mine so I posted the version I had)... Still something happened to editor... must have been stuck on older version or something (dunno how this sw works, it didn't update and Google store only has uninstall and open, no update... Same as yesterday)

Anyways, now photos can be used by other apps after editing and saving them on Google Photos (aka no need to save as copy and bloat gallery with duplicates).

Last steps:

1. I took new photo, checked that it can be opened on Snapseed/added to Whatsapp. I close apps without editing the photo
2. I edit/crop photo on Google Photos and save it
3. I can open photo on Snapseed or attach it to Whatsapp without error
4. Great success, clearing the Google Photos app's data seemed to fix the "can't load some photos" error

Huge thanks for the help and spending time to figuring this out, I wouldn't have dared to remove the Google Photo's data on my own as it was saying it removes everything from account (and it did but it all came back)

RegrettableNorms • 2mo ago

That's great! Sounds like there was an issue with the database mapping between the Photos app and the place in the filesystem where they are actually stored. Really glad you were able to resolve it

Defora OP • 2mo ago

Sadly the editor has now reverted back to what it was earlier and the issue came back with it.

I created a separate post asking if there is an alternative for Google Photos or I might just swap phone to Samsung as these issues with photo editing are really annoying and pretty much prevent me from using photos which was the main reason for switching the phone
