Wife's new phone walks itself off tables

Edit to reflect latest info:

Pixel 10 walks off table, regardless of vibration intensities. This is before putting protection / cover on it. Determined that the phone's glass is so slippery that even a slight incline it'll move downhill. Does this without any vibration, it just simply has zero grip. Vibration exaggerates it. There may also be a magnetism or magnetic component, although the super slippery glass seems sufficient explanation.

Tested against my Pixel 10 XL pro - both super slippery and XL pro slides off a table faster.

Apparently this isn't a new issue. Google wtf, nobody wants a device that falls off a table when the bubble level is slightly off.

Pixel 7 Pro 📱

Sounds like the root cause is your wife has too many notifications 😂. Not sure how you could even sleep with it buzzing all night.

You can either turn down vibration intensity, have the phone go on silent overnight, or have her disable some notifications.

Edit: actually on closer look it appears the phone is so slippery it slides on even a slight incline. No vibration required.

No actually I did some investigating because the issue is intermittent and positional and saw something weird when I put my Pixel 10 XL in the same spot. After it stopped vibrating it kept moving very slowly, like without friction. It eventually stopped. The last time I saw something like that was around magnets. Don't these phones have magnetic chargers or something?

Table 1 has steel rods for the drawer underneath.

Table 2 has a steel trash can, which the phone fell next to when it fell off the table.

Other tables I tested it vibrated within expectations.

It's not a defective phone, it's just vibrations doing their thing.

You or your wife can turn down the vibration intensity in settings, slap a case or grippy skin on the phone or just put it somewhere else.

**JamesHutchisonReal** OP • 1mo ago**tgrsnpr** • 1mo ago

Something tells me that the table your wife places her phone on is not center. I place my phone on my table all the time with the intensity to the highest and my phone has never slipped off.

You could try and see on a different table or set the vibration intensity lower. But if that table is off center, there's still a possibility that the phone could still be on the floor if just the right amount of notifications come through.

We did an experiment and recorded a video. It's clearly defective, either in production or design. It moved 1 inch after a single phone call. It basically rotated itself until it was optimally aligned to fall off, then starts walking itself off.

Pixel 10

I'd suggest getting a case or phone mat or something. I don't think it'd count as a defect to have your phone move an inch after letting your phone buzz for 30 seconds.

**JamesHutchisonReal** OP • 1mo ago

Does yours do this?

**CaptainBonkmood** • 1mo ago

Just trying the vibration settings that many people are already suggesting and then get back to us if it's still happening.

**JamesHutchisonReal** OP • 1mo ago

Won't. Already in store to get a new phone

Create

phone which will do the same. Check your table level for example.

And?

pockypimp • 1mo ago

Pixel 7

The back of the phones are so slick now that it does this. My friend demonstrated it with his 9 last year when we were out to dinner. The simple solution, a case.

Pixel 9a

Are your notifications vibration settings all the way up on the intensity setting? Go into your "Sound & Vibrations" settings and make sure your intensity isn't cranked up.
