No_Particular7571 Pixel 10 Pro

...

[Investigation] I deep-dived into the Pixel 10 Pro's telephoto video stutter and I have definitive proof it's a long-standing EIS software bug. (Video Evidence Included)

Hey r/GooglePixel,

After noticing some unsettling jerky movements in my new Pixel 10 Pro's telephoto video, I went down a deep rabbit hole to figure out if it was my unit or a bigger issue. What I found seems to be a multi-generational software problem, and I've created a video to prove it. 🤔

My journey started when I noticed the issue, got worried, and then found a Google Community post about the [Pixel 8 Pro](#) having the *exact same* "jumps" in its telephoto video. This made me investigate further.

Here's a summary of my findings:

- **It's a Widespread Issue:** I went to a retail store and tested both a display model of the **Pixel 10 Pro** and a **base Pixel 10**. With the default video stabilization (EIS) enabled in the settings, **both phones exhibited the exact same jerky video artifacts** on the 5x telephoto lens. This isn't just my phone.
- **The Culprit is EIS:** The jerky movements completely disappear if you turn off Electronic Image Stabilization (EIS) in the camera settings. The Optical Image Stabilization (OIS) on its own works beautifully. The issue reappears in third-party apps like ProShot if you enable their EIS option, which likely uses Google's API.
- **The Ultimate Proof (Video Link Below):** I created a detailed comparison video. It shows that footage shot with only OIS can be perfectly stabilized in post-production using DaVinci Resolve's stabilizer. The result is completely smooth, which is how the phone's native EIS *should* work. This proves the source footage from the camera sensor is fine and the problem lies within Google's real-time EIS algorithm.
- **Another Clue ("Video Boost"):** The "jumps" also disappear if you use the "Video Boost" feature. The initial recording is jerky, but the final version that comes back from Google's servers is perfectly stabilized. This again points to a software/processing issue, not a hardware one.

Here is the link to the full investigation video on YouTube. It clearly shows all the comparisons: [my personal video comparison](#)

My question to the community is: could you please test your Pixel 10 or 10 Pro/XL? **The main condition is to make sure Video Stabilization is ON in your camera settings.** Are you seeing these same jerky artifacts when panning with the 5x telephoto lens?

It seems this is a long-standing software bug where the EIS aggressively conflicts with the OIS, and it's something Google can and should fix. It's much easier to patch a software algorithm than to fix a hardware calibration issue. Let's gather some more data here! 🙌

Thanks for your help! 🙏

UPD

To **disable EIS** (*Video Stabilization*), go to the camera settings and find this switch as in the [screenshot](#).

Final Update & A Call to Action!

Hello everyone,

[Skip to main content](#)[+ Create](#)

Here is the link to the official [Bug Report](#)

HOW YOU CAN HELP:

If you are experiencing this issue, please go to the link above and **STAR (☆) the issue & i am impacted** in the top left & right corner. This is the most important way to show Google's engineers how many people are affected. Starring the issue works like an upvote and increases its priority.

Thank you all for your help in investigating this. Let's hope we can finally get it fixed! 🙏

Update (Sep 26)

Hello everyone, a quick update. I submitted a comprehensive bug report to the Google Issue Tracker with all the evidence we've gathered.

Unfortunately, the report was closed with the status "Won't Fix (Obsolete)". The reason given was that the tracker is only for "Android Open Source Developers," not for end-users like us. They redirected me to the generic Pixel Help Community.

This is frustrating, but it gives us a clear path forward. It means that individual bug reports on the Issue Tracker will likely be ignored.

THE MOST EFFECTIVE ACTION WE CAN TAKE NOW:

The best way to report this is through the on-device feedback tool. Please, if you have this issue:

1. Go to **Settings > About phone > Send feedback about this device**.
2. Describe the issue and, most importantly, **include the link to the YouTube video proof** in your description.
3. Make sure the option to **include system logs** is enabled.

The more reports they receive through this specific channel, the harder it will be for them to ignore. Thank you for your continued support!

Pixel 9 Pro XL

My question is why isn't Google looking into this with however many people are working on camera software with the pixel?

Are they even using these phones

That's what confuses me about bugs that everyone experiences

Why wouldn't they want to improve their own experience

**No_Particular7571** **OP** • 5mo ago

Pixel 10 Pro

I don't get it either. They should have testers who use the Pixel. I like this smartphone in almost everything, but I'm very disappointed with the way the telephoto lens behaves in video shooting...

I will make a bug report from the camera and spam Google, maybe someone will join this and there will be a kind of flash mob, so that Google will pay attention to it

**user642268** • 4mo ago

Is there a way to fix this stutter shit video at 10 pro?

**No_Particular7571** **OP** • 4mo ago

Pixel 10 Pro

For now, the only workaround is disabling **EIS - Video Stabilization** - in the settings, or using a third-party free app like [OpenCamera](#). So far, bro, there's no fix, at least I can't confirm that Google has resolved it. But I'll definitely let you know if there's any progress.

11 more replies

**horatiobanz** • 5mo ago

Top 1% Commenter

I can't imagine they have a huge team working on cameras. They've essentially made no progress over the last 7 generations of phones with regards to cameras. Super minor improvements, mostly small tweaks to contrast and color. A 1 person team couple accomplish these improvements given a year between each release with ease.

**RidetheSchlange** • 5mo ago

You would actually be wrong. Google paid HTC some ungodly sum in the low billions for their entire engineering which included their imaging division. Coming from HTC, it's beyond obvious that the optics, hardware, software, and rendering is in line with what HTC would have been by

[Skip to main content](#)

Create

**P4NICBUTTON** • 1mo ago

because all they care about is attracting investors. they've realized that customer satisfaction doesn't really correlate to revenue anymore and that they'll make a lot more money by shoehorning ai features into their phones instead of fixing existing issues.

**WatchfulApparition** • 5mo ago

Pixel 10 Pro XL

It's not just telephoto though. Even video boosted videos are affected.

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

That's an interesting point 🤔. I need to test "video boost" with the EIS disabled and enabled, will it create artifacts in both cases or only in one. I haven't used Video Boost much, to be honest. I tested it once and it did a good job of stabilizing a jerky video after processing.

However, I generally don't use it for a specific reason: when you shoot in 4K with Video Boost enabled, the source video is actually saved in Full HD (1080p). It's then sent to the servers, boosted with HDR+, and upscaled back to 4K.

In my opinion, this process doesn't make much sense for now. If the boost worked on the native 4K source file to just reduce noise and improve dynamic range, I would use it all the time. But upscaling from 1080p feels like a compromise.

**Unbreakable2k8** • 4mo ago

Pixel 10 Pro XL

Just used video boost with my 10 Pro at a concert and "boosted" videos have added jitters and jumps. And stabilization in general appear not to be working. I sent feedback and hope to see a fix soon, or I will return my phone.

[7 more replies](#)**HopesAnd--Dreams** • 5mo ago

Pixel 10 Pro XL

Wait, Video Boost does not upscale 1080p video. The 1080 is just a preview. Another video is recorded, with much more information; it's like a raw format that is later processed. That's why you need to upload lots of GB even for a short video.

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

So, if that's true, then I was wrong. I thought the full HD video was the original, not a preview. This changes everything. Although, of course, it doesn't fix the problematic EIS...

[Skip to main content](#)

Create

**Acceptable-Ideal8195** • 5mo ago

I have also had the same 5x jitters when I was testing it the other day. However, I cannot find a setting to disable EIS? Is it just the generic 'video stabilization' setting in the app?

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

Yes, that's it – the EIS. Even if you disable it, all three modules will still be stabilized by the OIS. It's just that without the digital stabilizer, the picture isn't as smooth 🤖

**Pentosin** • 5mo ago • Edited 5mo ago

8Pro to 10pro XL

~~Cant turn it off tho.~~

Edit: Nvm, there is 2 different places for stabilisation settings. can turn it off in the full settings.

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

Go to the camera settings, then find the "Video" section. There should be a toggle called "Video Stabilization" - you need to turn it off and that will disable EIS. I'm just not sure about the exact names of the menu items since my phone isn't in English.

**Pentosin** • 5mo ago

8Pro to 10pro XL

Yeah, i was abit quick to comment.

[Skip to main content](#)[+ Create](#)

It's worse in darker environments too (really obvious with lights in the background of the shot). I was really hoping they would improve it this year, but they just focused on AI gimmicks again because they can market that to people who aren't tech geeks.

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

I probably didn't notice it much on my old 6a because of the smaller camera modules... but now I ran straight into it after switching to their new flagship. AI features are nice and all, but how have they still not fixed the camera algorithms after all this time? It really doesn't seem like the hardest thing to patch.

**flagroller** • 5mo ago

Pixel 9

I think they are referencing the stabilization motion blur artifacts from normal videos.

Basically, if your shutter speed is too low in videos and you stabilize it in post, you will see objects that are no longer moving a lot have motion blur artifacts. Pixel default videos will show this, but this can be fixed by recording at higher shutter speeds. That gets rid of "cinematic" motion blur, but I don't think anyone shooting auto videos from their phone cares. Theoretically a slightly larger sensor should help, as you get a bit more light to get a higher shutter speed.

The reason I suspect them of talking about this separate issue is the mention of low light. You can't afford a higher shutter speed in low light, so the auto settings bring the shutter speed way down and bring the motion artifacts to stabilized videos.

Clearly across all lenses EIS requires tuning, but Google is slacking on camera improvements of the early days and gambling on Gemini.

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

Maybe you're right. Maybe they really meant it. I didn't pay much attention to that detail. For me, the most deplorable thing right now is the EIS's aggressive behavior in the telephoto lens

**aerog16** • 5mo ago

Yeah sorry, the point I was trying to make with my low light comment was just that poor stabilization is more obvious in dark environments than during daytime using auto camera settings. Even the iPhone struggles in low light, but seems to do better at stabilizing from what I've seen.

There are a lot of videos on YouTube showing it, but this is a decent example:

<https://youtu.be/oifehl5o0b8?si=3XDBZklf7aJY9pfW&t=1m45s>

Video boost helps a bit with this, but ain't no one got time for that haha.

[Skip to main content](#)[+ Create](#)

Didn't need a deep dive, this has been a behavior on pixels forever and it's not limited to the telephoto (it's just more obvious).

But it's not just the EIS stutter that sucks, it's also the hyperactive viewfinder floating when you zoom in, despite being very stable. Pixels (at least my 9 pro XL) are terrible with this, and it's nothing new.

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

Now I realize this issue has been around for a long time. It's just that when I bought the 10 Pro after the 6a and ran into such an obvious problem with the telephoto camera algorithms, I got worried that the stabilizer itself might be defective and started investigating. I immediately searched for information, then tested it through different software and even compared it in a store with other units of the same phone.

That's why I decided to share this with the community and also try to get Google's attention - since this problem has been dragging on since previous Pixel generations. Maybe together we can push such a corporation to finally take action?

**ssspxe** • 5mo ago

The video jitter and zoom jitter is what's stopping me most. I don't care for benchmarks and such but if I can't even use video properly that is seriously holding me back, and it hasn't been fixed ever since.

Can't believe how many down votes i got for a thread saying pixel video is horrible with jitter.. these are people who haven't used other phones who don't realise how bad it is.

Pls let me know if you find a fix and I'll purchase a new pixel.

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

I hope we can raise awareness so that Google will hear us and fix this problem.

**KeythKatz** • 5mo ago

N5| N5X 🍷 |2XL|4XL|6P|F

EIS is complete shit, you can point at, and record one thing on the viewfinder, but the recording will show a different angle entirely.

**techraito** • 5mo ago

Pixel 9

Top 1% Commenter

Man, EIS was the saving grace back in the Pixel 2 and the combo of OIS + EIS made it the most stable phone for video recording of its generation (though clarity has always gone to iPhones). OIS must have had some major improvements over the past few years for people to rag on EIS now.

[Skip to main content](#)[+ Create](#)

EIS is still relevant in combination with EIS, especially when you're doing something active. For example, I really miss EIS when I'm recording video while riding a bike. So I have to compromise: either keep stabilization always on for active videos, or turn it off for the telephoto lens.

**KeythKatz** • 5mo ago

N5| N5X 🍷 |2XL|4XL|6P|F

Always keep it off, and use Google Photos' stabilization for videos that need it. It works ridiculously well and doesn't even need to be uploaded to the cloud.

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

I just tested it too - the built-in Google Photos stabilizer fixes the footage instantly without even needing DaVinci. Thanks!

That makes me twice as frustrated that Google still can't get the EIS algorithms right, when their own post-processing tool handles it perfectly. So yeah, I'm stubborn enough to keep knocking on their door together with the community and through bug reports. Maybe it's naive, but it's worth trying.

**Baspower** • 5mo ago

Pixel 10 Pro

I got an error while saving the video, but switching from AV1 to H.265 format solved it for me. Now I can stabilize in google Photos

**RaguSaucy96** • 5mo ago

There are three stabilizer tools that I trust for Android.

1- Google Photos stabilizer

2- <https://play.google.com/store/apps/details?id=kallossoft.videostabilizer>

And the best but hardest (which also needs gyro data)

3- <https://play.google.com/store/apps/details?id=xyz.gyroflow>

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

I get you - this really frustrated me too, especially since I've been waiting for a proper telephoto lens for so long, and it's exactly there where this annoying issue shows up. I'm used to editing my footage afterwards and it's no problem for me to add stabilization in DaVinci. But honestly, this should just work out of the box. That's why I'm trying to make some noise about it - I mean, how can Google not fix such an obvious software bug for almost 3 years now? On the main camera modules everything works fine.

Skip to main content

Create

shaping the future of AI.

online.stanford.edu**onolide** • 5mo ago

Hmm I wonder if we can create an Issue on the Android Issue Tracker so Google can see this(and hopefully assign someone to fix it)? I don't have a P10 to test this, but I definitely believe there's an issue here

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

I'm definitely going to file a report on this, and it'd be great if others join in. You don't even need a Pixel 10 - the issue shows up on any Pixel with a telephoto, and some say even on the main lenses. The more of us push, the harder it'll be for Google to ignore.

**Firouzi** • 3mo ago

Pixel 10 Pro XLPW3 41mm

Google service said we should report it based on the pixel reporting issue, if we can create that all of us send issue to them. it gets harder fro them to ignore.

**Maxitay** • 5mo ago

I did the test and yes, same behavior as you. Last time I was at a concert and the footage from the x5 while panning over the orchestra was soooo bad because of the jitter that is was unusable. I don't remember having this problem with the x5 lens on P6 Pro... That's a shame...

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

Did I get it right that back in the P6 Pro days this issue wasn't there? If so, then it's clear Google introduced an EIS bug at some point and never fixed it. Really sorry about the ruined orchestra footage... I just hope we can push Google to finally solve this so there are no compromises when using Pixel cameras.

**Best_Ad4323** • 5mo ago

[Skip to main content](#)[+ Create](#)

...nificantly helped but I could still see some minute jitter when holding the camera steady.

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

Unfortunately, even optical stabilization won't make a telephoto lens completely smooth. Due to the heavy and large camera module, they tend to exhibit a certain amount of movement. I saw this on a Panasonic GX80. There, too, due to its size, the OIS didn't completely dampen the shaking and leveling during stops. Logically, a well-tuned EIS should work symbiotically with the OIS. But alas, Google hasn't calibrated this yet.

**DreamLearnBuildBurn** • 5mo ago

Hey this has been a problem for SEVERAL GENERATIONS of Pixels. Not sure if OP knows that, but yes, it's been well-known as a software-side problem for years.

**No_Particular7571** OP • 4mo ago

Pixel 10 Pro

I only found out about this after a Reddit post and one Google Community post about the 8 Pro. But I gathered enough evidence to Google and a cause-and-effect relationship to figure out what the error might be. There is hope that Google will finally start to fix this error. + the community also participated in this, Google definitely heard us, as the rhetoric in supporting Pixel changed.

**BlackPanthaa** • 4mo ago

Thanks for the deep findings on this, this really frustrated me as a Pixel guy that needs my phone for video sometimes. I will file a report as you mentioned.

**No_Particular7571** OP • 4mo ago

Pixel 10 Pro

And thank you for participating in the bug report! After some of the publicity we generated, it looks like Google has at least taken this issue into consideration. And now even support says they're aware of this issue. They've given me the option to send a detailed bug report directly to Google engineers. I found a possible root cause of the problem, which affects not only the telephoto lens, but also the main cameras and Google Photos, and is also related to electronic stabilization. I'll definitely make a new post by the end of the work week, where I'll tell the Reddit community about everything and our little victory.

**BlackPanthaa** • 4mo ago

That's amazing! Yes I have the issue appear on the main lens, front camera seems ok. I will look out for the updated post!

[Skip to main content](#)[+ Create](#)

the recording? Crazy

**No_Particular7571** OP • 4mo ago

Pixel 10 Pro

Just to clarify, when you say "changing subject of the recording," do you mean when the camera refocuses from a far object to a near one? If so, then this is true: the phone doesn't always correctly determine which lens to use. While you can manually select the lens in photos, you can't in videos, which is odd. You can manually select it in third-party software. For me, the main stuttering happens with EIS enabled, especially when panning. Disabling it makes the footage much smoother

**Apprehensive-Bug9480** • 4mo ago

Yes im not a english native speaker, sorry. Disabling that option helps a lot, but what happens in my case is if i move rapidly the object of the recording and come back i literally see a shake in the visual that is still recorded in the final video.

**No_Particular7571** OP • 4mo ago

Pixel 10 Pro

I understand, I'm not a native English speaker either, so I'll clarify just in case :) Theoretically, image shake will persist, especially with a telephoto lens. At least, I compared it to a still camera. Panasonic GX80. It has optical stabilization, but with 60mm+ lenses you can see movement when moving, especially when stopped. It's inertia and the optical system that makes it difficult to hold a massive matrix as stable as possible, and in the case of our pixels, a massive telephoto lens module. Therefore, the EIS should logically correct these fluctuations, which the OIS is no longer able to compensate for. That's why I'm trying to get Google to fix the EIS algorithms, since according to my tests, the EIS is broken on absolutely all cameras, from ultra-wide-angle to telephoto lenses. I'll prepare a post on this topic by Friday, with videos and examples. For now, the only way to stabilize the image is to use editing programs, I use DaVinci.

And most importantly, write bug reports to Google en masse!

[+ 1 more reply](#)**Longjumping_Door_147** • 4mo ago

I am here available for the community and for Google pixel fans like me. Tomorrow I think I'll go and collect my 10 pro xl and leave the iPhone 17 pro max 😂 I miss the pure Android experience too much and among other things I want to solve this situation because if we have to wait for Google to solve it, another 10 generations of Google pixels will pass. If you like tomorrow when you post the other 3D, invite me or tag me.

**Apprehensive-Bug9480** • 4mo ago

[Skip to main content](#)

Create

**No_Particular7571** OP • 4mo ago

Pixel 10 Pro

My new post covers both the main and wide-angle cameras. And also video stabilization via Google Photos. So, the issue is with literally all cameras, even Google Photos. Essentially, the problem is with the digital stabilization API itself. 🤔

**Apprehensive-Bug9480** • 4mo ago

I solved him in a way. Choose 1080p 30 fps and choose ACTIVE STABILIZATION (an icon of a guy running)..not normal One that is default (the hand symbol) seems solving the issue in my case! Such a shame that we should downgrade our capabilities in order to Fix. Could you try man?

**No_Particular7571** OP • 4mo ago

Pixel 10 Pro

Yes, it really works, but unfortunately it's a really aggressive crop :(And I have a feeling this is a crop from the main camera, not the telephoto lens, so the stabilizer works better. Because the quality drop is so significant.

I just checked this idea again, it's really most likely the main camera, and not the telephoto lens in this stabilization mode with the running guy.

**Apprehensive-Bug9480** • 4mo ago

I know you confirmed in such a way that is a software bug issue. I really hope its, because in this case we can wait an hotfix One day. Im scared its an hardware defect..and we Need to use our warranty.

**No_Particular7571** OP • 4mo ago

Pixel 10 Pro

I think if this is a hardware issue, then Google has been producing defective devices for at least four generations. There are a lot of comments from people with previous models. I also checked another 10 Pro and a basic 10 in the store, exactly the same symptoms. Well, Google support itself acknowledged this.

So I don't think you need to worry about the hardware, there's a good chance the phone itself is fine 😊

**Apprehensive-Bug9480** • 4mo ago

Thanks dude, im saying this because support helped me today with live chat and suggested to boot the phone in maintenance mode , and test the issue again (spoiler the issue was still presente) and they proposed to repair It under warranty. But i declined because i knew your posts/investigations and i Will wait an hotfix. Meanwhile if its really hardware defect i Will Just use my warranty..2 years left.

[Skip to main content](#)

Create

Sometimes it's easier for them to offer to replace the phone under warranty. Apparently, it's a matter of luck, whether you get an employee who's in the know or one who's not. If anything happens, I recommend you point out that this is a widespread issue. Otherwise, let's hope they fix it, otherwise they'll keep throwing us back and forth like a warranty ping-pong. 🙄

**Apprehensive-Bug9480** • 4mo ago

Sorry to bother you but Watching the video i showed to you, with main camera, do you think its still linked on what you showed in reddit and YouTube? Seems different. I really hope thats not hardware issue in my case. Because i can see something also disabling stabilization options

**No_Particular7571** OP • 4mo ago

Pixel 10 Pro

Okay, I found your video! I just checked it on the main camera, but at home, where space is limited, it doesn't seem to exhibit the same behavior as in your video. I'll try testing it again outside tomorrow. Is there some pattern to the actions so I can repeat them?

So, I advise that if there are stores nearby where you can check the exact same phone model, repeat the same thing with the model from the store. At least that's how I was able to rule out a hardware issue at first when I saw the exact same problem with other Pixels in the store.

1 more reply

**BallDesire** • 4mo ago

I may be totally missing the point, but I found moving the camera to 60fps from 30 basically fixed it for me

**No_Particular7571** OP • 4mo ago

Pixel 10 Pro

And was the base resolution 4K or FHD? For me that trick didn't work at all - only if I force stabilization with a hard lock, but that only works in FHD-30fps 🙄

**Unbreakable2k8** • 4mo ago

Pixel 10 Pro XL

Just updated manually to Pixel Camera 10.1 (APKM + APK Mirror installer) and the stutter and stabilization issues appears to be fixed for me. I'll do more testing but this looks promising, I was ready to return my Pixel 10 Pro because of this.

[Skip to main content](#)

Create

Pixel 10 Pro

Did you also not get the update via the Store yet? I've manually installed it several times, but it doesn't fix anything for me.

There was one miracle moment - on the previous build - where the stuttering disappeared! But OpenCamera broke at the same time, like OIS wasn't working at all. Meanwhile, EIS in ProShot worked great, no jumps. I got excited... but decided to reboot the phone just to be sure - and boom, the bug came back.

1. **Could I ask you to let me know how your tests go once you've done them?**
2. **And if it's not too much trouble, could you also try rebooting your phone - just to see if the bug returns after that?**

After that "*miraculous healing*" and its sudden reversal, I wrote to support again in the same bug report thread. I recorded video proof and captured logs, sent everything to them. I also asked if there's any difference between the official update from the Store and the one from APKMirror.

Support said they'd forward all the info and questions to the engineers. I've been waiting for a reply since October 17...

**Unbreakable2k8** • 4mo ago

Pixel 10 Pro XL

It was not live on Play Store so downloaded the APKM. Did a video boost test in low light with panning and switching between the lenses, and it's very smooth, before and after the Video Boost. Needs more testing but looks promising so far.

I never used Open Camera so I don't know if that has any importance here.

Pixel 10 Pro XLPW3 41mm

interesting:

so Finally after hours talking to CS google. finally a wise one helped called Joseph :D

easy solution:

Here are the steps to enter Repair Mode:

Go to Settings.

Scroll down and tap System.

Select Repair Mode.

Tap Enter Repair Mode. (You will need to enter your PIN/password to authorize this).

[Skip to main content](#)[+ Create](#)

I did: Issue was fixed.

then leave the repair mode. the camera seems working fine -> worked on my Pixel 10XL

International_Load10 • 2mo ago

Oh I really hate this, I loved P8P stab but P10P is so frustrating.

I have another question for you guys with P10P. So the when I record a video holding my phone vertically, when I'm using tele lens (x5) and when I tilt my phone forward and backward, like up in down in the viewfinder my image ROLLS. So when I pitch my phone up a little my image moves CLOCKWISE a little, it is super weird like stab trying to counter the movement but WRONG movement. It is not totally wrong since sensor is placed on the side, but it really does a bad job doing this. When I do fast pitch up and down a can literally see my image ROTATES. Never seen that with P8P which has same camera placement. Am I not the only one I hope?

Thanks!

No_Particular7571 OP • 2mo ago

Pixel 10 Pro

Look at my other videos, are there similar distortions as you describe? In my videos, these camera shifts are not only horizontal but also vertical. But I'm not quite sure that I understand correctly about rotation 🤔

But, to give you peace of mind, if you turn off this stabilization and the camera works correctly without it, then everything is fine with the hardware, it's just a software issue

International_Load10 • 2mo ago

So, I will try to explain it again, I just checked with my friend and he has the same thing so it's must be normal and logically it's normal too.

So the thing is that the EIS is applied AFTER recording for some reasons in Google Camera (it wasn't the same for Pixel 8 Pro and it's not like that for BM Camera which applies EIS right into the viewfinder) and because of that you are only seeing OIS working. The "issue" I am talking is only visible in the viewfinder of stock camera or BM Camera set to OIS only.

Soooo, if you pitch your phone a little, like a fast movement around the imaginary axis from volume button on the right to the left side of the phone. Gentle fast pitch. While doing this you will see that the image ROTATES a little clockwise and counterclockwise. You won't see it after EIS kicks in, but the explanation is pretty simple: since we have periscope and the sensor is turned by 90° to a phones back pitch leads to a sensor rotation in it surface.

Anyway it something near that topic but in total yeah, x5 lens stab is very bad. For sure we are asking a lot, like having 100mm+ lens and smooth videos handheld is VERY difficult, I cannot always pan perfectly with 105mm OIS + IBIS on my Lumix cam, but the problem is there is no obvious winner. iPhone is better for panning, sensor shift does it well but little vibrations - much

Pixel 10 Pro

I tried to do the same thing, including in Blackmagic. And only with the OIS there really is such a moment, but as you said, this is normal, the stabilizer is trying to compensate. However, the lens stabilizer itself does not have rotation, at least not on a telephoto lens. It is stabilized on two axes. But the rotation must be compensated by the EIS. But it is impossible to use it, if you start doing the same actions with the EIS enabled, the camera starts jumping even more than when panning 🤖

Regarding the iPhone, it has a tetraprism, which is smaller than a prism. It is easier to stabilize. If we were to compare Pixel, it would only be with Samsung, one of its closest Western competitors. And I compared it with the C25 Ultra, its EIS works much better, there are no such jumps. But the OIS is approximately the same.

In principle, I like the work of the OIS, but the EIS has been around for a long time and I have no idea why Google messed with it. Considering that the first Pixels were completely without OIS.

The comparison with a camera is also good. I also compared with Lumix GX80. I don't remember exactly how many mm the lens was, but it was about 100. That's why I have no complaints about the image sensor, since it works about the same as a large stabilized matrix in a camera. This is roughly what I expected when I bought the Pixel, but I was disappointed with the camera's behavior with the EIS enabled...

**vlajkosav** • 5mo ago

What are you talking about? How could you claim that Google has software problems? This is actually a new interdimensional AI image stabilisation feature. I won't go into the details, but we live in a multiverse and Google's AI stabilises video across all universes. It's intentional — it's a feature — powered by a new AI chip inside Google's Tensor, and you should be happy about it.

**DialMMM** • 5mo ago

OP, have you tried the Active setting?

**No_Particular7571** OP • 5mo ago

Pixel 10 Pro

If I understand the setting correctly, active stabilization is only available in Full HD, and it's a crop. The quality is poor in Full HD in this mode, so shooting with a telephoto lens is pointless.

Pixel 10 Pro

I wanted to share this with the Reddit community first. I wanted to see how widespread this problem is, but my sample size was small. At least with this post I learned that this is a widespread problem. I even helped someone with advice on how to partially resolve the issue. And ask the community for help, too, and report the error to Google. If there's a massive response, maybe they'll listen. And thanks for the link, I'll work on sending a bug report 🙏

**Longjumping_Door_147** • 4mo ago

Dear Pixel fan, I love Pixels for their graphics and style. This year, I skipped the 10 Pro XL because I've become picky about video quality, especially since most brands now offer a log profile, and they work great even in "auto" mode. See the S25U or the Vivo X200 Pro, for example. They shoot high-quality videos without any major issues, especially in low-light conditions, where the Pixel 10 Pro XL and previous models struggle too much!

The 10 Pro XL is there, waiting for me at MediaWorld, but I don't have the courage to buy it because I already know it will disappoint me with the video quality. However, I'd be thrilled if we could get Google to fix the problem together.

I should mention that last year alone, I sent about 20 software reports to my Google account with the 9 Pro XL. Weeks passed, the Pixel camera and Google firmware received monthly updates, but nothing, it was never fixed, and I sold it, tired of that quality, which, by the way, doesn't just focus on the telephoto lens, but also on the 0.5x and 1x focal lengths and the 2x crop.

I don't know how much feedback I've sent over the past few years with the Pixels I've received, but the problem has always been there, and I don't think Google wants to fix it, especially since they implemented the useless Video Boost, designed only to lure people and tie them to the cloud for a function that should run the smartphone out of the box without the aid of online tricks.

Will they blame the low-performance SOC? I don't know, but I'm sure that sending error reports has never worked in four years, and everything makes me think I'm the only one who noticed this kind of problem. I mean, I don't think I'm the only idiot on earth who showed Google by sending feedback that their video camera suffers from severe jittering and areas of noise in low-light environments, and that switching between focal lengths is ridiculous.

Years have passed, but everything has remained unchanged, and this makes me angry because a Pixel 10 Pro XL costs as much as an S25U or iPhone or other devices I'm not mentioning. We are the stupid users (unaware, also due to a lack of knowledge about how video works, and therefore ignorant on the subject) who take it for granted that the Pixel works well because it's Google, but no, it doesn't.

I've been posting videos I've made over the years in the same places, including the dates I'll be working on them. I'll definitely post the ones I made with the 10 Pro XL, which I'll be getting soon.

why not, solve this problem once and for all.

Let's get in touch!

No_Particular7571 OP • 4mo ago

Pixel 10 Pro

Hey! Thank you for such a detailed and heartfelt comment. I feel your pain. I'm a huge Pixel fan myself. Even though I've only had one previous model – the Pixel 6a – I fell in love with it and was really excited to upgrade to a flagship. So this year, I moved from the 6a to the 10 Pro.

And yes, it's so frustrating that we can only get log files through third-party software. The lack of manual video controls in the native camera app is a huge missed opportunity. 🙄

I completely understand your hesitation to buy the 10 Pro XL. At first, I was terrified, thinking my brand-new phone was defective and worrying about how I'd even handle a warranty claim in a foreign country. But then I started digging, testing, and realized the problem was in the software. So I truly get your desire to finally get some action from Google.

I'm just starting to figure out the best way to get a response. I'm not sure how you've been sending your reports – through the generic feedback tool or via Google Support. But at least after my big post, I managed to get a support agent to acknowledge that they know about the problem and will escalate it. It took a few tries, though, as I was getting bounced around before that. And you are absolutely right, I've also noticed that the ultrawide and main cameras have issues too! I'm preparing a new, more comprehensive post about this with a call to action for the whole community. I'm not 100% sure, but I think I've found the root cause in the logic of how the EIS works in general, and I'm going to show what I mean in a video I'm releasing tomorrow.

I agree that Video Boost stabilizing things better than the real-time EIS is kind of a joke. The final picture is nice, but it's not as good as what a proper tool like DaVinci Resolve can do. And about the SoC – you're right, blaming the chip would be a terrible excuse. The early Pixels were famous for their incredible EIS. It feels like Google messed something up around the Pixel 6 generation when the telephoto lens was introduced, and it's been a snowball effect ever since.

I watched all three of your videos, and they only strengthen my conviction that the EIS algorithm is way too aggressive. I'm just so glad I'm not alone in this. Finding so many people under my post who agree and support this has been amazing. Thank you again for your incredibly detailed comment!

I will be posting a new thread with my full investigation, an explanation of the potential core stabilization problem, and a guide on how to send bug reports directly to the engineers. I'd be really grateful if you and others would join in. If we can create enough resonance, Google will have no choice but to listen and act, otherwise they risk losing their most loyal fans.

I'll be around, just let me know. I'm new to Reddit, so I'm still getting the hang of it!

"It looks like you are raising an issue as an Android user, rather than an Android Open Source Developer."

**No_Particular7571** OP • 4mo ago

Pixel 10 Pro

Yes, I wrote that in the post. There's a different way to submit a bug report through Pixel Support. I wrote about this in detail with proof in my last post.

**Firouzi** • 3mo ago

Pixel 10 Pro XLPW3 41mm

interesting, Pixel 7 camera, had no issue with flickering camera, update to Pixel 10 XL all around flickering! it just doesn't fix the shutter speed as it should, google solution. hard reset. / which I know will not fix the issue.

**No_Particular7571** OP • 3mo ago

Pixel 10 Pro

What kind of flickering are you talking about? Is it similar to pointing the camera at an LED lamp with a low refresh rate? In photo or in video? I haven't really encountered that, except in objectively bad lighting - like a cheap string of lights with awful flicker that you can almost feel with your eyes 🤔

**Firouzi** • 3mo ago

Pixel 10 Pro XLPW3 41mm

Yes camera shutter speed, for me was worse outside in shops even worsening

Pixel 4 Pixel Slate Pixel 10 Pro XL

is the issue still exist? i tried with my pixel 10 pro xl after the December update but i can't reproduce the issue anymore.

**No_Particular7571** OP • 2mo ago

Pixel 10 Pro

Yes, the problem is not fixed. [Here's a video](#) with confirmation, this is not my video, but another user's

**Late_Challenge3466** • 2mo ago

Has this been fixed in version 10.2?

[Skip to main content](#)[Create](#)

yet. And the bug, unfortunately, is still there...

P4NICBUTTON • 1mo ago

typa post google employees will completely ignore

[deleted] • 1mo ago

Hi, besides this 5x issue, have you encountered any other issues with the Pixel 10 Pro's videos? Especially when moving in low light? I was thinking of upgrading to the Pixel 10 Pro, but I'd like to know all the limitations in video compared to iPhones or flagship Samsungs.

No_Particular7571 OP • 1mo ago

Pixel 10 Pro

Hi! I haven't encountered any bugs specifically when shooting at night with the main modules. But as far as I remember, there were a lot of comparisons and night shooting was worse than the iPhone. Unfortunately, I don't have the opportunity to make a direct comparison between the three brands. But I wouldn't say it's terrible, just a little worse. And for night shooting, Video Boost works very well. Of course, with its own nuances in the form of waiting for processing But the telephoto lens, not counting its problem with stabilization, is clearly better simply because of the larger sensor size and prism design, compared to the iPhone's tetraprism, and it needs to be compared with the Samsung. And perhaps in night video at the moment, while moving, it is worth abandoning electronic stabilization and relying only on the OIS 🤔

[deleted] • 1mo ago

<https://youtu.be/AQ1jtVajjkw?si=mp49UhNomF2iOT8j> I found this video. At minute 29:43, it compares it to the Pixel 10 Pro at night. Since I'm not an expert, I'd like to know your opinion. I'd like to shoot some videos in low light, and maybe you can tell me if the Pixel 10 Pro produces good results for you. Since I always read on Reddit that Pixels don't take good videos, I'd like to get an opinion from someone who actually has one.

AlternativeTest5375 • 13d ago

Interesting. I bought myself a Pixel 10 Pro XL a few days ago and noticed the same behavior, the only extra on my end is that the whole phone just shuts down after I start recording a video with image stabilization on, no error message or anything, it just dies.

Sometimes immediately after I start recording, sometimes it manages to record for 2 minutes or slightly more, but it eventually shuts down.

Create

**No_Particular7571** OP • 13d ago

Pixel 10 Pro

Wow, something new with this problem. Tell me, are you shaking your phone too much? If there is strong shaking, there is a chance that the OIS will be forcibly switched off in order not to destroy the mechanism. And in theory, this could still cause a software failure and turn off the phone.

Of course, I can't give an answer right away, since I don't think I've encountered a shutdown specifically. But early in my investigation, I did encounter OIS shutdowns due to severe shaking.
